

## **Create Environment and Culture for Innovation Via A System**

Jie Wang, MD, PhD

Professor and Executive Vice-President, Jiangsu Academy of Clinical and Translational Research, Jiangsu Province Hospital, Nanjing, China

With the world fastest economic growing and aggressive healthcare reform, China is hungry for new technologies, therapies and products in medical practice. Many 3A class hospitals have accumulated research experience, state-of-art facilities, well-equipped laboratories, well-founded projects, financial supports, talented physician scientists and desire to innovate. Whether these resources can be conveyed into innovations it is a question because innovation is only occurred with proper environment and culture. Further, the value of innovation needs to be realized via commercial activities. How should we leverage the resources to innovations and complete the conversation of an innovation to a clinical therapy/product, it is still a huge challenge in China. I will deliver two talks during the 6<sup>th</sup> Annual IP Seminar, “Create Environment and Culture for Innovation Via A System”, and “SyMap Medical Ltd, A New Venture with IPs as Main Driving in China”; in these two talks I will discuss these issues and present real cases to support my points of views.
